

Machine Language Coding

By Dan Kohn
University of Southern Mississippi
Computer Engineering Technology

Converting ASM to Machine Code

- In general, each Machine instruction specifies:
 - What operation is to be performed
 - Operand(s)
 - Byte or Word Operation
 - Reg to Reg OR Reg to Mem
 - Addressing mode (if Mem)

One Byte Instructions

- Generally specify a simpler operation with a register or flag bit.

General Instruction Format

General Instruction Format

Opcode (6 bits)

Specifies the operation, such as add, subtract or move, that is to be performed.

General Instruction Format

Register Direction Bit (D Bit)

Tells whether the register operand specified by REG in byte 2 is the source or destination operand.

Logic 1 indicates destination
Logic 0 indicates source.

General Instruction Format

Data Size bit (W bit)
8 or 16 bit operation

Logic 0 – 8 bit
Logic 1 – 16 bit

General Instruction Format

Byte 2

Mod Field (mode)

00 – Memory mode (no displacement follows)
01 – Memory mode (8 bit displacement follows)
10 – Memory mode (16 bit displacement follows)
11 – register mode

General Instruction Format

Byte 2

Reg Field
Identifies the register for first operand

REG	W=0	W=1
000	AL	AX
001	CL	CX
010	DL	DX
011	BL	BX
100	AX	SP
101	CX	BP
110	DX	SI
111	BX	DI

General Instruction Format

Byte 2

R/M Field Specifies the 2nd operand (Dependent on MOD field)

MOD=11			EFFECTIVE ADDRESS CALCULATION		
R/M	W=0	W=1	MOD=00	MOD=01	MOD=10
000	AL	AK	000 (BX) + (DI)	(BX) + (SI) + DS	(BX) + (SI) + DI16
001	CL	CK	001 (BX) + (DI)	(BX) + (DI) + DS	(BX) + (DI) + DI16
010	DL	DX	010 (BP) + (SI)	(BP) + (SI) + DS	(BP) + (SI) + DI16
011	BL	BK	011 (BP) + (DI)	(BP) + (DI) + DS	(BP) + (DI) + DI16
100	AH	SP	100 (SI)	(SI) + DS	(SI) + DI16
101	CH	BP	101 (DI)	(DI) + DS	(DI) + DI16
110	CH	SI	110 DIRECT ADDRESS	(BP) + DS	(BP) + DI16
111	BH	DI	111 (BX)	(BX) + DS	(BX) + DI16

Example 4.1

- Convert the following to machine language
MOV BL, AL
- 1st find op code in table 3-6. In our case:

DATA TRANSFER

MOV = Move

	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0
Register memory to/from register	1 0 0 0 1 0 0 0	Mod: reg r/m	(DISP.LD)	(DISP.M)		
Immediate to register/memory	1 1 1 0 0 1 1 1	Mod: 0 0 0 r/m	(DISP.LD)	(DISP.M)	data	data, r/m=1
Immediate to register	1 0 1 1 1 1 1 0	data	data, r/m=1			
Memory to accumulator	1 0 1 0 0 0 0 0	Mod: 0 0	Mod: r/m			
Accumulator to memory	1 0 1 0 0 0 1 0	Mod: 0 0	Mod: r/m			
Register memory to register/register	1 0 0 0 1 1 1 0	Mod: 0 0 0 r/m	(DISP.LD)	(DISP.M)		
Segment register to register/memory	1 0 0 0 1 1 0 0	Mod: 0 0 0 r/m	(DISP.LD)	(DISP.M)		

So our first bits will be 100010

Example 4.1 (cont)

2nd Bit D, determines whether the register specified by the REG part of byte 2 is a source or destination operand. We will encode AL in REG field of byte 2; therefore, D is set to 0 for source operand.

Example 4.1 (cont)

3rd Bit W, this is an 8 bit operation so W will be set to 0

This makes byte one of the instruction:

$$10001000_2 = 88_{16}$$

Example 4.1 (cont)

4th The source operand is AL so we set the REG to 000 (as per fig 4.2)

5th Since the second operand is also a register, MOD field is set to 11 (as per fig 4-3a)

6th R/M is now set to 011 to indicate the destination is BL (as per table 4-3b).

Example 4.1 (cont)

This makes byte two of the instruction

$$11000011_2 = C3_{16}$$

So the machine code for MOV BL, AL is:

$$88C3_{16}$$

But.....

There is a second answer to the example:

If the D bit is changed to a 1 (so the REG of byte two is destination) then:

Byte 1 of the instruction is 10001010_2 or $8A_{16}$

But..... (cont)

Byte 2:

The Destination operand is BL so we set the REG to 011 (as per fig 4.2)

Since the second operand is also a register, MOD field is set to 11 (as per fig 4-3a)

R/M is now set to 000 to indicate the source is AL (as per table 4-3b).

So the second byte would be 11011000_2 or $D8_{16}$

Debug

Debug is a DOS program that is used to:

- write and debug a machine language / ASM program
- examine / modify memory
- examine / modify IO Ports
- examine / modify registers.

Read sections 4.3 – 4.10 (you will need to know this for future labs!)
